## Problem (Affine Equivalence Problem)

*For given permutations  $F, S : \mathbb{Z}_2^n \rightarrow \mathbb{Z}_2^n$ , find affine mappings  $A, B : \mathbb{Z}_2^n \rightarrow \mathbb{Z}_2^n$  satisfying  $F = B \circ S \circ A$  if they exist.*

# Affine Equivalence Problem and Previous Works

## Problem (Affine Equivalence Problem)

*For given permutations  $F, S : \mathbb{Z}_2^n \rightarrow \mathbb{Z}_2^n$ , find affine mappings  $A, B : \mathbb{Z}_2^n \rightarrow \mathbb{Z}_2^n$  satisfying  $F = B \circ S \circ A$  if they exist.*

- Naive approach to solve the problem takes  $O(n^3 2^{n^2+n})$  times:  $\forall A$ , to check if  $B = F \circ A^{-1} \circ S^{-1}$  is affine and invertible.
- The Affine Equivalence Algorithm proposed by Biryukov et al. in Eurocrypt 2003 recovers both  $A$  and  $B$  in  $O(n^3 2^{2n})$  times.

# Our Problem

## Problem (Our Specialized Affine Equivalence Problem)

Let  $F, \hat{S}$  be given  $n$ -bit permutations s.t.  $\hat{S}$  is a concatenation of  $m$ -bit S-Boxes for  $n = m \cdot s$ . Suppose that there exists a pair of affine maps  $A, B : \mathbb{Z}_2^n \rightarrow \mathbb{Z}_2^n$  s.t.  $F = B \circ \hat{S} \circ A$  and  $A$  has a certain known structure w.r.t.  $m$ .<sup>1</sup> Find  $A'$  and  $B'$  s.t.  $F = B' \circ S \circ A'$  and  $A'$  has the same structure with  $A$ .

<sup>1</sup>We call it as “structured”

# Our Problem

## Definition (Structured Matrix, Structured Affine Map)

A matrix  $L \in \mathbb{Z}_2^{n \times n}$  is called structured w.r.t.  $m$  where  $n = m \cdot s$ , if

1  $L$  is invertible and

2 defining the  $s \times s$  matrix  $M_L$  as

$$(M_L)_{i,j} = \begin{cases} 0 & \text{if } (i,j)\text{-th } m \times m \text{ block of } L \text{ is zero} \\ 1 & \text{Otherwise} \end{cases}$$

, the rows of  $M_L$  are pairwise distinct.

An affine map is called structured w.r.t.  $m$  if the linear part of the affine map is structured w.r.t.  $m$ .

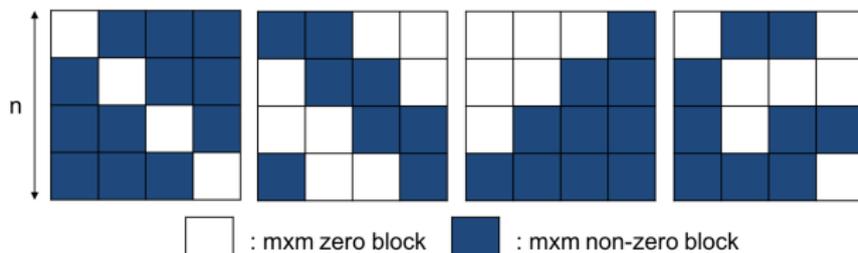

Figure: Examples of structured matrix

# Sketch of Attacks

**Step1. WANT:**

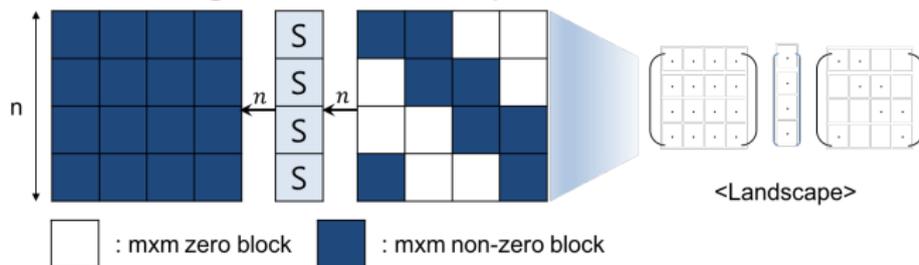

# Sketch of Attacks

**Step1. WANT:**

■ Once viewing  $F$  in a landscape,

We do differential attacks. That is, fixing  $P_1 + P_2 = \begin{pmatrix} \cdot \\ \cdot \\ \cdot \\ \cdot \end{pmatrix}$ , observe  $F(P_1) + F(P_2) \in \mathbb{Z}_2^n$ .

■ Observation:

$$\dim\{F(P'_1) + F(P'_2) \mid P'_1 + P'_2 = P_1 + P_2\} = 2m (\ll n)$$

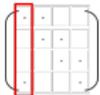

■ Observation:

$$\dim\{F(P'_1) + F(P'_2) \mid P'_1 + P'_2 = P_1 + P_2\} = 2m (\ll n)$$

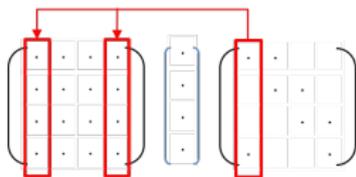

$\implies$  *Why?*: Because of the first column  of  $A$ .

■ Observation:

$$\dim\{F(P'_1) + F(P'_2) \mid P'_1 + P'_2 = P_1 + P_2\} = 2m (\ll n)$$

$\implies$  *Why?*: Because of the first column  of  $A$ .

Moreover, since the differential activates the first column of  $A$ , and the first column of  $A$  activates the first and the last column of  $B$  depicted as

, we can see the subspace  $\{F(P'_1) + F(P'_2) \mid P'_1 + P'_2 = P_1 + P_2\}$

of  $\mathbb{Z}_2^n$  is generated by  of  $B$ .

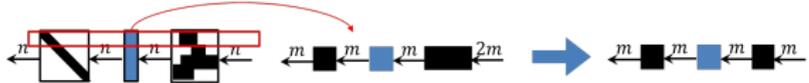

- Fixing  $P_1 + P_2 = \begin{pmatrix} \cdot \\ \cdot \\ \cdot \\ \cdot \end{pmatrix}$ , we obtain the column space generated by  $\begin{pmatrix} \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \end{pmatrix}$  of  $B$  over  $\mathbb{Z}_2$ .
- Fixing  $P_3 + P_4 = \begin{pmatrix} \cdot \\ \cdot \\ \cdot \\ \cdot \end{pmatrix}$ , we obtain the column space generated by  $\begin{pmatrix} \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \end{pmatrix}$  of  $B$  over  $\mathbb{Z}_2$ .

By calculating an intersection of two subspaces over  $\mathbb{Z}_2$  obtained as above, we achieve a basis of the column space of  $\begin{pmatrix} \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \end{pmatrix}$  of  $B$ .

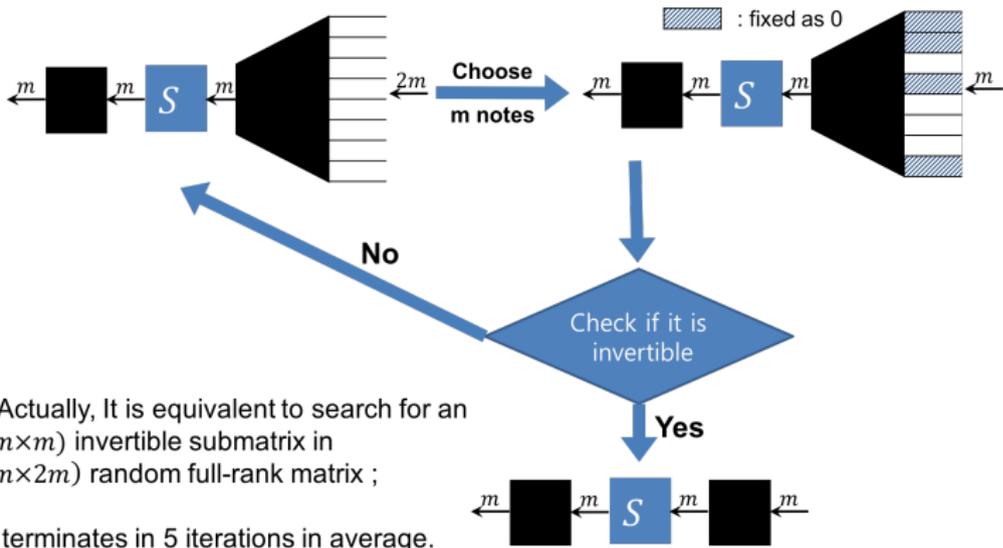

( $\therefore$ ) Repeating this process for  $\left(\frac{n}{m}\right)$  times, as a result, we can decompose  $B$  as

$$\begin{array}{c} \blacksquare \\ B \end{array} = \begin{array}{c} \text{\hat{B}: known, } U: \text{unknown} \\ \begin{array}{c} \blacksquare \\ \hat{B} \end{array} \cdot \begin{array}{c} \blacksquare \\ U \end{array} \end{array}$$

Step2. WANT:

- Return to bit scale.

- Apply AEA to solve the affine equivalence problem for

# Main Theorem and Comparisons

## Theorem (Solving the Specialized Affine Equivalence Problem)

Let  $F, \hat{S}$  be given  $n$ -bit permutations with the same conditions as in the problem setting. One can solve the specialized affine equivalence problem for  $F$  and  $\hat{S}$  in time

$$5 \cdot \left( \frac{n}{m} \cdot \log_2 \frac{n}{m} \right) \cdot n^3 + 5 \cdot n^2 \cdot 2^m + n \cdot m^2 \cdot 2^{2m}$$

with  $\frac{n}{m}(2n + 5 \cdot 2^m + m + 10)$  chosen plaintexts.

We significantly reduced the complexity of solving affine equivalence problems for the special cases.

- We reduced the main terms of complexity proposed by Baek et al. since we don't need  $F^{-1}$  calculations.
- Even with  $F^{-1}$  oracle, Baek et al. approach requires  $O\left(\frac{n}{m} \cdot n^3 \cdot 2^{3m}\right)$  time complexity which is larger than ours.

# Main Theorem and Comparisons

**Example.** Considering several sample parameters, required work factors to solve our problems are as below.

- **Case 1.**  $n = 128, m = 8$

(a)AEA:  $2^{277}$  , (b)Baek et al. SAEA:  $2^{75}$  , (c)Our Algorithm:  $2^{31}$

- **Case 2.**  $n = 256, m = 8$

(a)AEA:  $2^{536}$  , (b)Baek et al. SAEA:  $2^{110}$  , (c)Our Algorithm:  $2^{34}$

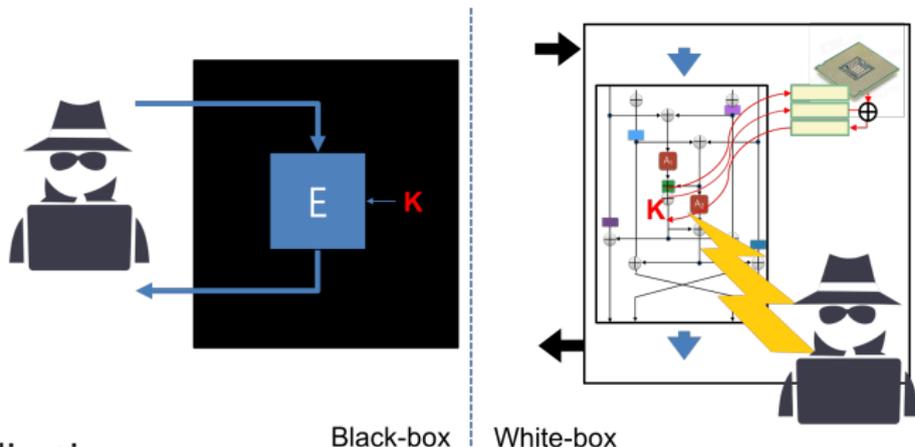

- **Case 3.**  $n = 256, m = 16$

(a)AEA:  $2^{536}$  , (b)Baek et al. SAEA:  $2^{188}$  , (c)Our Algorithm:  $2^{48}$

# Application to White-Box Implementations

What is “White-Box implementation” ?

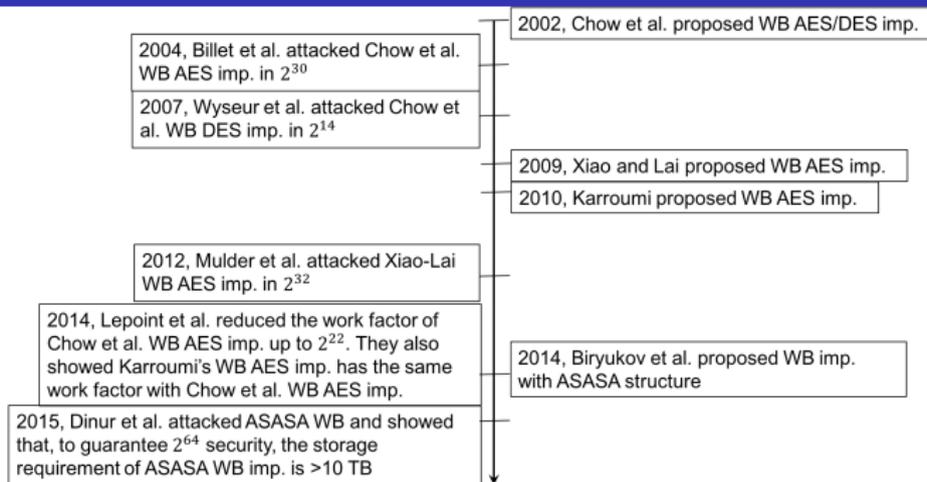

- Goal: Obfuscating secret keys in the software

- Applications

- iOS upgrades
- Digital Rights Management(DRM):  
Games, recorded music, newspapers, films, magazines

# Brief History of White-Box Cryptography

- In this area, it seemed to be hard to construct a WB imp. with a work factor more than  $2^{35}$  and a reasonable storage requirement.
- Baek et al. challenged to resolve this problem, proposed a WB imp. of claimed complexities  $2^{75}$  and  $2^{110}$  with storage requirements 16MB and 64MB, respectively. *However, the construction is vulnerable to our attack algorithm so that they couldn't achieve the security goals.*

## Conclusion

- For  $n$ -bit permutations  $F$  and  $\hat{S}$ , the complexity of solving an instance of the affine equivalence problem is highly reduced up to

$$5 \cdot \left( \frac{n}{m} \cdot \log_2 \frac{n}{m} \right) \cdot n^3 + 5 \cdot n^2 \cdot 2^m + n \cdot m^2 \cdot 2^{2m},$$

where  $\hat{S}$  is a concatenation of  $m$ -bit S-boxes and the input affine layer is structured with respect to  $m$ .

- Our algorithm will serve as a useful attack tool for White-Box implementations. Actually, with our methods, we can extract the secret key of White-Box AES implementation proposed by Baek et al. with work factors  $2^{32}$ ,  $2^{33}$ , and  $2^{34}$  for  $n = 128, 256$  and  $384$ , respectively, while claimed security were  $2^{75}$ ,  $2^{110}$ , and  $2^{117}$ .

## Further Works

- To implement the whole attack algorithms
- Can we generalize our attack method to solve the original Affine Equivalence problems?
- To construct a secure White-Box implementations with an appropriate storage requirement
