What?

Molecular Communication

- How do biological systems **share information**?
- What are the practical **communication limits**?
- **Molecules** are commonly used between cells, tissues, organisms

Image: US CDC <http://www.cdc.gov/tb/education/corecurr/pdf/chapter2.pdf>

Why?

Why Study Molecular Communication?

Why are we (from communications and signal processing) interested in *Molecular Communication* for signaling?

- We can **help understand biological systems**
- We can **help interface with biological systems**
- We can **gain inspiration for design** of synthetic networks

Why?

- We can **gain inspiration for design** of synthetic networks

Biological
Signaling

Communications and
Signal Processing

Why?

What are Some Target Applications?

Medical and healthcare applications

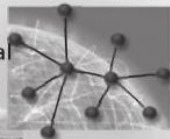

Targeted drug delivery

Intracellular therapy Nanomedicine

Biosensor and actuator networks

Environmental monitoring

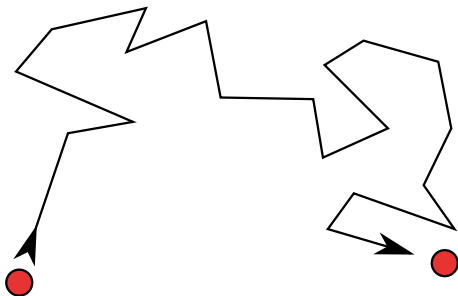

Environmental applications

How?

How are Molecules Transported?

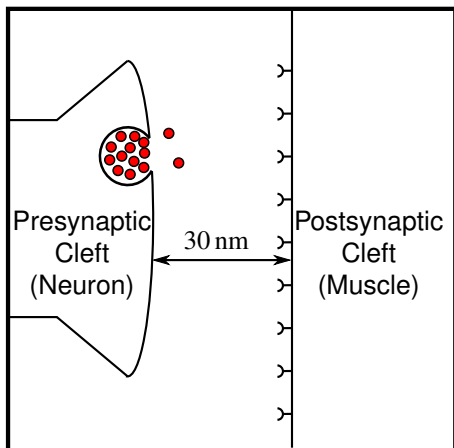

Diffusion – transport by colliding with other molecules

- **No external energy** or infrastructure required
- **Very fast** over “short” distances ($\leq 1\mu\text{m}$)
- Used by **many processes in cells**

Examples in Biology

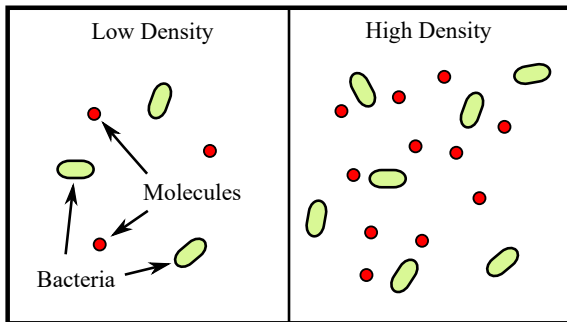

1) Neuromuscular Junction

- Motor neuron to muscle fiber
- Molecules released ($\sim 10^4$)
- Reception \rightarrow contraction
- Up to 50 **times per second**

Examples in Biology

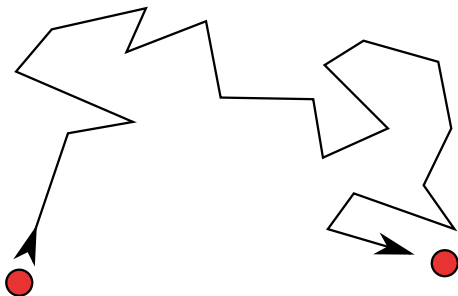

2) Quorum Sensing in Bacteria

- Bacteria release molecules
- Individual bacteria estimate population density
- Bacteria **favor cooperative behavior** when density is high

Unique Features of MC Systems

What Distinguishes MC from Conventional Communications Analysis?

Features of diffusive molecular communication systems:

- **Discrete objects** – physically collected and transported
- **Uncertainty in diffusion trajectory** of each molecule
- Environmental phenomena – e.g., **chemical reactions, fluid flow**
- **Limited computational resources** – small devices such as cells

Improving Channel Models

6 Conclusions

The Diffusive Channel

Consider a single transmitter (TX) and receiver (RX)

- Molecules are **released by TX**
- RX makes observations
- Describe channel with the **channel impulse response (CIR)**
- CIR may not be tractable – Need **simplifying assumptions**

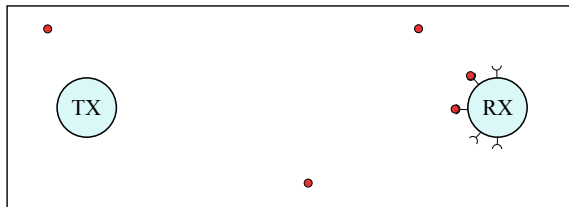

The Diffusive Channel

Consider a single transmitter (TX) and receiver (RX)

- Molecules are **released by TX**
- RX makes observations
- Describe channel with the **channel impulse response (CIR)**
- CIR may not be tractable – Need **simplifying assumptions**

The Diffusive Channel

Consider a single transmitter (TX) and receiver (RX)

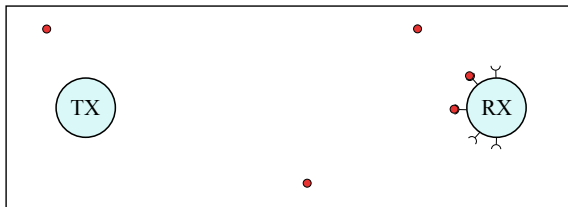

- Molecules are **released by TX**
- RX makes observations
- Describe channel with the **channel impulse response (CIR)**
- CIR may not be tractable – Need **simplifying assumptions**

Point vs Volume Devices

Point-to-Point Assumption

Common to model TX and RX as points. Is this assumption accurate?

Other assumptions:

- Instantaneous release of N molecules by TX
- Molecules diffuse with diffusion coefficient D
- Distance between TX and RX is fixed at d
- RX has a **passive surface** that molecules can diffuse through

Point vs Spherical Receiver

$\bar{N}_{RX}(t)$ – number of molecules expected at RX as a function of time

3D Point Receiver Observation (Point TX) – “Classical” Result

$$\bar{N}_{RX}(t) = \frac{NV_{RX}}{(4\pi Dt)^{3/2}} \exp\left(-\frac{d^2}{4Dt}\right)$$

3D Spherical Receiver Observation (Point TX)

$$\begin{aligned}\bar{N}_{RX}(t) = & \frac{N}{2} \left[\operatorname{erf}\left(\frac{r_{RX} - d}{2\sqrt{Dt}}\right) + \operatorname{erf}\left(\frac{r_{RX} + d}{2\sqrt{Dt}}\right) \right] \\ & + \frac{N}{d} \sqrt{\frac{Dt}{\pi}} \left[\exp\left(-\frac{(d + r_{RX})^2}{4Dt}\right) - \exp\left(-\frac{(d - r_{RX})^2}{4Dt}\right) \right]\end{aligned}$$

Point vs Volume Transmitter

Don't worry, this is the last slide focusing on math ...

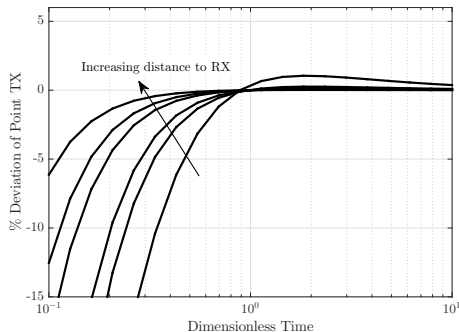

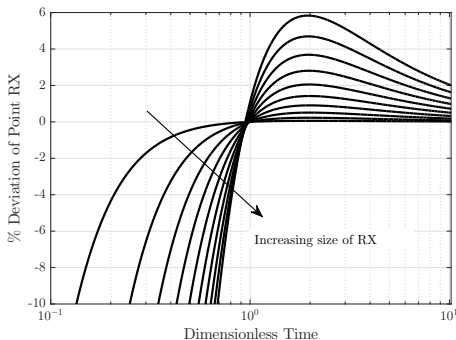

1D Receiver Observation (Point TX)

$$\bar{N}_{\text{RX}}(t) = \frac{N}{2} \left(\operatorname{erf} \left(\frac{r_{\text{RX}} + d}{2\sqrt{Dt}} \right) - \operatorname{erf} \left(\frac{d - r_{\text{RX}}}{2\sqrt{Dt}} \right) \right)$$

1D Receiver Observation (Volume TX)

$$\begin{aligned} \bar{N}_{\text{RX}}(t) = \frac{N}{2r_{\text{TX}}} \Bigg\{ & \sqrt{\frac{Dt}{\pi}} \left[\exp \left(-\frac{(x_{\text{f}} + r_{\text{RX}})^2}{4Dt} \right) - \exp \left(-\frac{(x_{\text{f}} - r_{\text{RX}})^2}{4Dt} \right) - \exp \left(-\frac{(x_{\text{i}} + r_{\text{RX}})^2}{4Dt} \right) \right. \right. \\ & \left. \left. + \exp \left(-\frac{(x_{\text{i}} - r_{\text{RX}})^2}{4Dt} \right) \right] + \frac{1}{2} \left[(x_{\text{f}} + r_{\text{RX}}) \operatorname{erf} \left(\frac{x_{\text{f}} + r_{\text{RX}}}{2\sqrt{Dt}} \right) \right. \right. \\ & \left. \left. - (x_{\text{i}} + r_{\text{RX}}) \operatorname{erf} \left(\frac{x_{\text{i}} + r_{\text{RX}}}{2\sqrt{Dt}} \right) - (x_{\text{f}} - r_{\text{RX}}) \operatorname{erf} \left(\frac{x_{\text{f}} - r_{\text{RX}}}{2\sqrt{Dt}} \right) + (x_{\text{i}} - r_{\text{RX}}) \operatorname{erf} \left(\frac{x_{\text{i}} - r_{\text{RX}}}{2\sqrt{Dt}} \right) \right] \right\} \end{aligned}$$

Point-to-Point Assumption

Accuracy of Point-to-Point Assumption

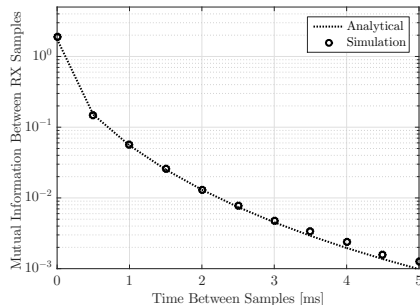

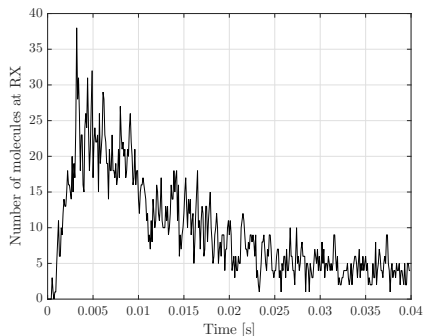

Accuracy improves as relative distance between TX and RX increases

Noel, Cheung, Schober, *Proc. IEEE ICC MoNaCom*, Jun. 2013.

Noel, Makrakakis, Hafid, *Proc. CSIT BSC*, Jun. 2016.

Independence of Molecule Counting

Molecules enter and leave RX – usually assume independent samples

Accuracy of Observation Independence

Accuracy improves as time between consecutive samples increases

Passive RX – No affect on molecule propagation

- Easier to simulate
- Easier to analyze (exponentials)
- Some biological justification

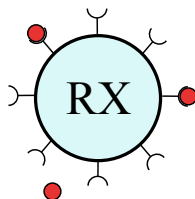

Passive RX – No affect on molecule propagation

- Easier to simulate
- Easier to analyze (exponentials)
- Some biological justification

Active RX – Model chemical detection of molecules

- More realistic
- Harder to simulate
- Less convenient analysis (error functions)

Reactive Surfaces

Summary of our results with reactive surfaces:

- Derived **CIR for reversible adsorption**, where molecules can stick and detach from RX surface
- Measured impact of **multiple absorbing RXs**
- Derived transforms to **convert between signals at passive and absorbing RXs**

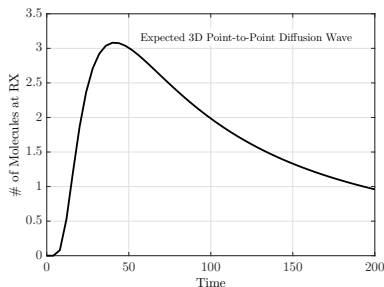

Deng, **Noel**, Elkashlan, Nallanathan, Cheung, *IEEE Trans. Mol. Biol. Multi-Scale Commun.*, Dec. 2015.

Lu, Higgins, **Noel**, Leeson, Chen, *IEEE Trans. NanoBiosci.*, to appear.

Noel, Deng, Makrakis, Hafid, *Proc. IEEE Globecom*, Dec. 2016.

- 5 Future Directions**
 - Transceiver Behavior
 - Information Theory in Biochemical Processes
 - Improving Channel Models
- 6 Conclusions**

Modifying the Communications Channel

Challenges with diffusion:

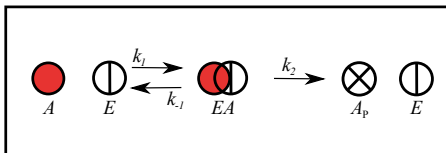

- **Propagation time increases** with square of distance
- Significant **intersymbol interference (ISI)**

Natural diffusive channels have modifications that improve signaling

- Neuromuscular junction has **molecule degradation**
- Blood vessels have **bulk fluid flow**

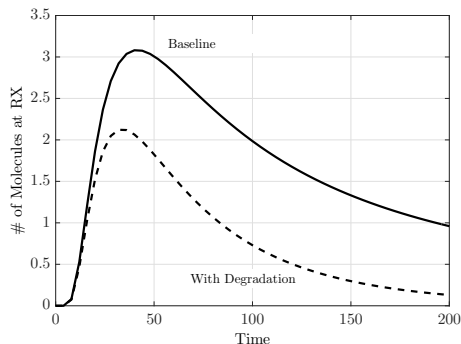

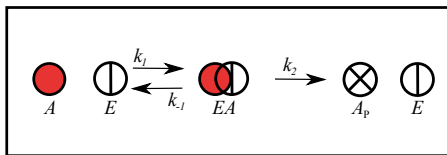

Molecule Degradation to Reduce Interference

Neuromuscular junction has enzymes

Molecule Degradation to Reduce Interference

Neuromuscular junction has enzymes

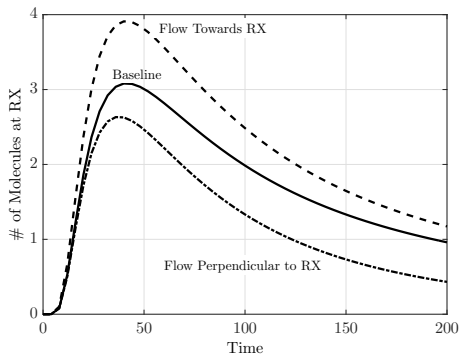

Impulse Response with Degradation

$$\bar{N}_{RX}(t) \approx \frac{NV_{RX}}{(4\pi Dt)^{3/2}} \exp\left(-kt - \frac{d^2}{4Dt}\right)$$

Noel, Cheung, Schober, *IEEE Trans. NanoBiosci.*, Mar. 2014.

Net Fluid Flow

Impulse Response with Flow

$$\bar{N}_{\text{RX}}(t) = \frac{NV_{\text{RX}}}{(4\pi Dt)^{3/2}} \exp\left(-\frac{(d-v_{\parallel}t)^2 + (v_{\perp}t)^2}{4Dt}\right)$$

Noel, Cheung, Schober, *IEEE Trans. NanoBiosci.*, Sept. 2014.

Channel Parameter Estimation Problem

Can we estimate the underlying channel parameters (distance, diffusion coefficient, etc.)? Why would we do this?

- Local **monitoring and diagnostics** applications
- **Tuning** transceiver parameters

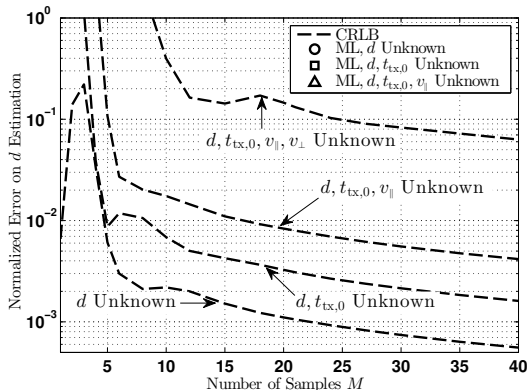

Consider RX taking M samples of an impulse response:

- Derived **Cramer Rao lower bound (CRLB)**
- Compared CRLB with **Maximum Likelihood** estimator
- Assessed **simpler estimators** using peak of impulse response

Channel Parameter Estimation Problem

Results

Consider estimating the distance:

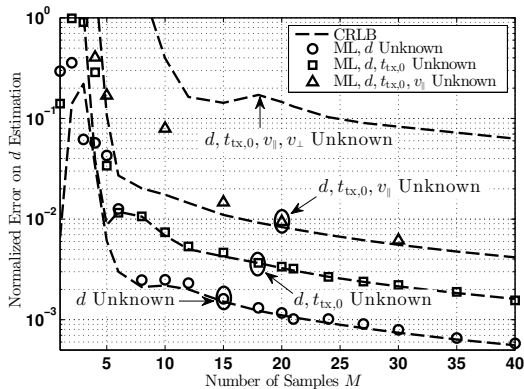

- CRLB increases as fewer parameters known
- ML is asymptotically efficient

Channel Parameter Estimation Problem

Results

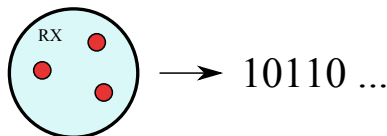

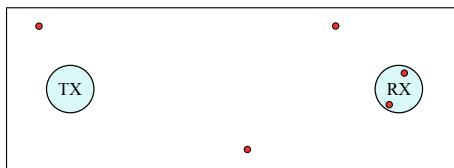

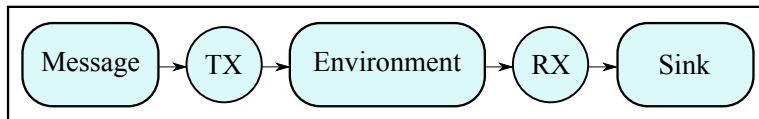

Consider estimating the distance:

- CRLB increases as fewer parameters known
- ML is asymptotically efficient

The Communication Problem

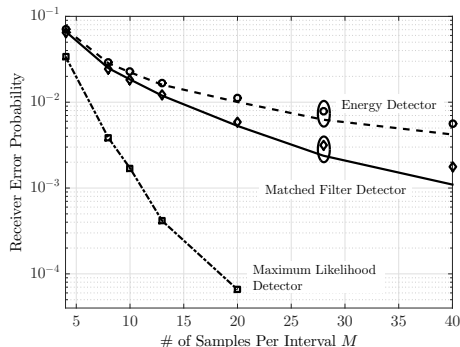

How to design a communication system?

- Different ways to modulate (time of release, # of molecules, etc.)
- Focus on impulsive **binary ON/OFF keying**
- Detect using **multiple RX samples per symbol** interval

- 1 Background – What is Molecular Communication?**
- 2 The Molecular Communication Channel**
 - Verifying Analytical Assumptions
 - Modifying the Communications Channel
 - Estimating Channel Parameters
- 3 Communications Performance**
 - Single TX-RX Link Design
 - Molecular Communication Networks

- 5 Future Directions**
 - Transceiver Behavior
 - Information Theory in Biochemical Processes
 - Improving Channel Models
- 6 Conclusions**

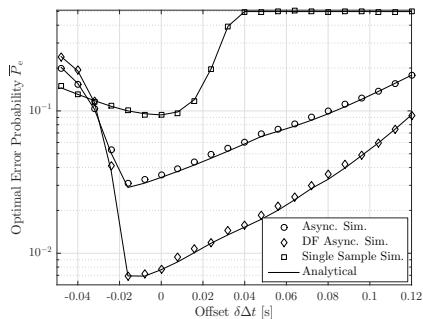

Optimal vs Suboptimal Detection

- **Energy detector** and **matched filter** with constant decision thresholds
- **Maximum Likelihood** detector based on Viterbi algorithm
- We can approach ML performance with molecule degradation and/or strong flow (not shown)

Asynchronous Communication

Consider RX with **imperfect timing information**:

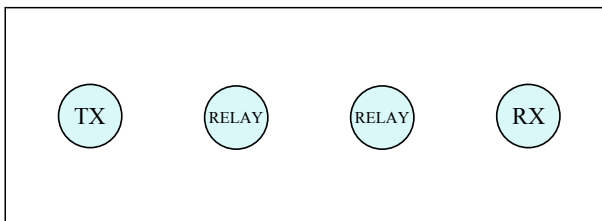

- Single sample detector uses *expected* peak
- **Asynchronous detector uses peak** in sampling interval
- Asynchronous detector **more resilient to timing offsets**
- Additional improvement with **decision feedback (DF)**

- 5 Future Directions**
 - Transceiver Behavior
 - Information Theory in Biochemical Processes
 - Improving Channel Models
- 6 Conclusions**

Multi-Hop Relaying

Can we use relays to reach **further destinations faster**?

Consider decode-and-forward and amplify-and-forward relaying

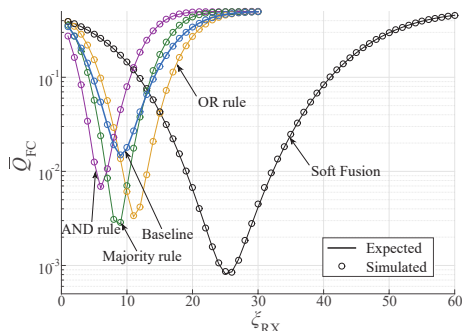

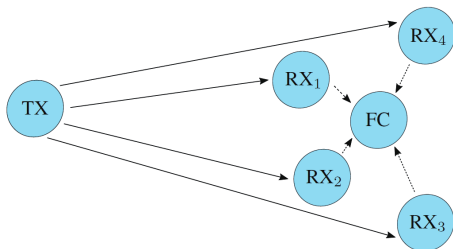

- Various schemes for **re-using molecule types** in different hops
- Identified **self-interference (SI)** and **backward ISI (BI)**
- Applied **decision feedback** to adjust RX and relay thresholds

Ahmadzadeh, **Noel**, Schober, *IEEE Trans. Mol. Biol. Multi-Scale Commun.*, Jun. 2015.

Ahmadzadeh, **Noel**, Burkovski, Schober, *Proc. IEEE GLOBECOM*, Dec. 2015.

Cooperative Detection

There is limited work about MC devices actually “cooperating”

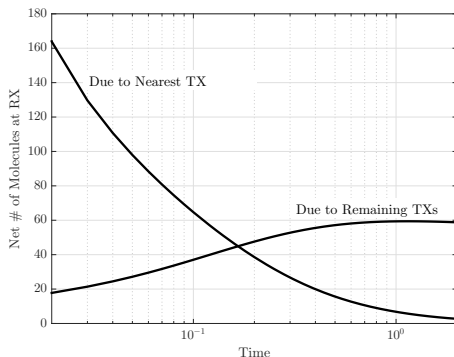

Consider multiple RXs communicating with a **fusion center (FC)**

- **Derived FC performance** when RXs make hard decisions
- Optimize RX and FC decision thresholds as a **convex problem**

Very Large Networks

What if we have a **very large number of TXs**?

- Can we communicate with **closest TX**?
- Derived channel response of closest vs remaining TXs
- Considered RX design when **all TXs transmitting together**
- Significant interference from distant TXs

Deng, **Noel**, Guo, Nallanathan, El Kashlan, *IEEE Trans. Mol. Biol. Multi-Scale Commun.*, submitted.

Existing Simulator Options

There are 2 broad categories of simulator available:

1 Reaction-diffusion solvers

- From the physical-chemistry community
- Generic “**sandbox**” **tools to customize environments**
- Not designed for communications (e.g., transceivers, statistics)

2 Molecular communication simulators

- From the communications engineering community
- **Designed for communications research**
- Constrained environmental design options

- Not designed for communications (e.g., transceivers, statistics)

2 Molecular communication simulators

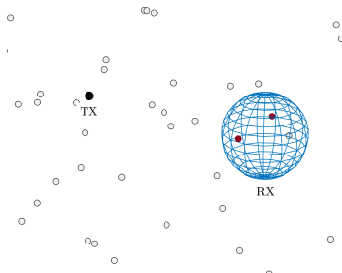

- From the communications engineering community
- **Designed for communications research**
- Constrained environmental design options
- Need: A “sandbox” simulator for communications research in reaction-diffusion systems
 - Improve learning curve for multi-disciplinary field
 - Encourage use of simulations

AcCoRD (**A**ctor-based **C**ommunication via **R**eaction-**D**iffusion)

- Flexible environmental design (“**sandbox**”)
- Generate *many* independent realizations
- Release molecules based on **modulated data**
- Track **number or locations** of molecules

AcCoRD Accessibility

Usability features:

- **Open source** development on Github
- Online user documentation
- Many **sample configurations** available
- Post-processing in **MATLAB** (figures, videos)

- ⑥ Conclusions**

Non-Ideal Transceivers

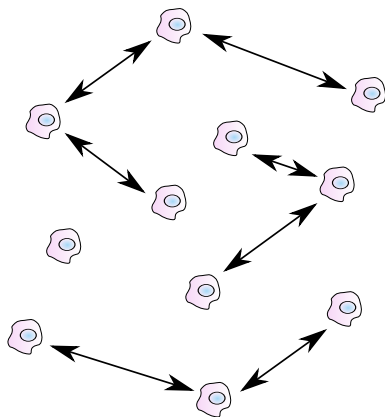

We assume devices **always** behave as intended

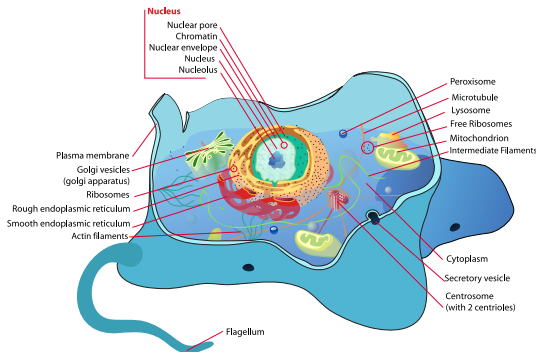

- Devices may unintentionally **disrupt or interfere** with natural system
- Devices **may not cooperate** as desired
- Can we gain insight into how we can **predict and control** node behavior?

Group Dynamics

- What if devices behave **selfishly**?
- Could a device **benefit by disrupting** common signals? (e.g., consuming molecules)
- What **incentives** exist for cooperation?
- **Game theory** could be applied to study these dynamics

Toxicity and Interference

- Cellular complexity is devoted to **maintaining a healthy state**
- Many molecules have **target concentration ranges**
- How can we **avoid toxicity** when introducing new signaling?
- **How much information** can we transmit and respect constraints?

Image: Wikimedia Commons https://commons.wikimedia.org/wiki/File:Animal_cell_structure_en.svg

Link Security

Does the conventional eavesdropper problem make sense here?

Some potential security-related problems:

- Can we **detect a “malicious node”** (e.g., tumor)?
- Can we **disrupt a diseased cell** that uses signaling to spread?
- Can we **avoid detection** by immune system?

- ⑥ Conclusions**

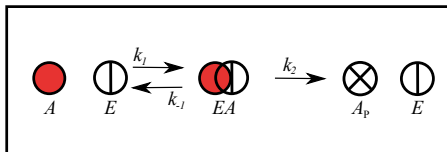

Measuring Neural Impulses

- Nerve cells (neurons) **propagate impulsive signals**
- Experiments have **externally triggered** neural impulses
- Both **number and timing** of action potentials are important
- How reliably can we **generate a target impulse train**?

Image: Wikimedia Commons https://commons.wikimedia.org/wiki/File:Neural_signaling.PNG

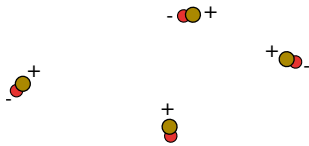

Mutual Information of Chemical Reactions

- Biochemical reactions occur with **significant stochasticity**
- **How much information can be transmitted** in a reaction?
- Can we **measure the mutual information** between samples of reaction output?

- 4 AcCoRD Simulator**
- 5 Future Directions**
 - Transceiver Behavior
 - Information Theory in Biochemical Processes
 - Improving Channel Models
- 6 Conclusions**

Improving Channel Models

Other physical phenomena can also modify molecule trajectories:

- Diffusion of **polar or charged molecules**
- Impact of **electric fields** (internal and/or external)
- Non-uniform flow (e.g., **laminar flow** in small blood vessels)

Improving Channel Models

⑥ Conclusions

Final Words

- Molecular communication **combines communications and biological signaling**
- MC offers **new perspectives** on communications analysis
- **Interact with biochemical processes** at a microscopic level
- Inspiration between biology and engineering is **bidirectional**
