Selection of LoRa Technology and SF (whistle)

Technology		Data Rate	Coverage	Remarks	
Copper Wired PLC		2-3Mb/s	1km to 3 km	Unreliable and noisy due to harmonics	
DSL	Wired Internet	Max 1Gb/s	100m	High capital cost for installation and least flexible	
	Fiber Optic	Max 14Tb/s	160km	Extremely high capital cost for installation and least flexible for SG	
Wireless	Wireless Local Area Network	54Mb/s	200m to 400m	Short Range, Vulnerable to EMI, Easy Installation	
	GSM	14.4kb/s	1km to 10km	Poor Data rate, Monthly cost, Low availability in remote locations	
	BlueTooth	250Mb/s	70-100m	Limited Coverage, Limited number of nodes	
	WifiWLAN	600Mb/s	100m	Small Coverage, Inherent drawbacks of Wireless Mesh Network	
	Radio Teletype	100b/s	Input supply dependent (0.7mV/m)	Outdated and analogue, Uses Electromechanical setup	
	Optical Wireless Communication	622Mb/s	Unlimited	Costly setup, Under experimental phase	
	WiMAX	75Mb/s	10-50km (Line of Sight) 1-5km (OFF LOS)	Poor penetration in obstacles due to HF, Inherent drawbacks of HF	
	Satellite Communication	1Gb/s	Unlimited	High Cost, Signal fading due to snow and rain, Signal latency	
	GPRS	170kb/s	1km to 10km	Poor Data rate, Less reliable due to voice traffic	
	Lora	Depends upon SF	5km to 15km	Low cost, Power saver, Easy Installation, Low data rate	
	Zigbee	250kb/s	30m to 50m	Short Range, Poor Data rate, Easy Installation	
	SigFox	100b/s	3-10km (Urban)	Low cost, High Scalability, Low data rate, Restricted number of messages per day	
	Cellular	Global Packet Radio System –GPRS- (2G)	170kb/s	1km to 10km	Poor Data rate, Licensed frequency band, Easy Installation
		High Speed Downlink Packet Access-HSDPA- (3G)	384KB/S TO 14.4Mb/s	1-10km	Licensed frequency band, Easy Installation, Limited availability
		Long Term Evaluation-LTE-(4G)	Max 42 Mb/s	1-10km	Licensed frequency band Easy Installation Limited availability

Secure Communication Flow Chart

- From plaintext, calculate unique MAC and encrypt message
- At the receiver end, the received message is decrypted and new MAC is calculated, and is compared with the received MAC to check the message security and authenticity

Implementation of Encryption Algorithms

- Shift Cipher

- Affine Cipher

- $y = a * x + b$ (key space $p(a) * p(b)$)

- Substitution Cipher

- $ab \longrightarrow cy$ (key space $N!$)

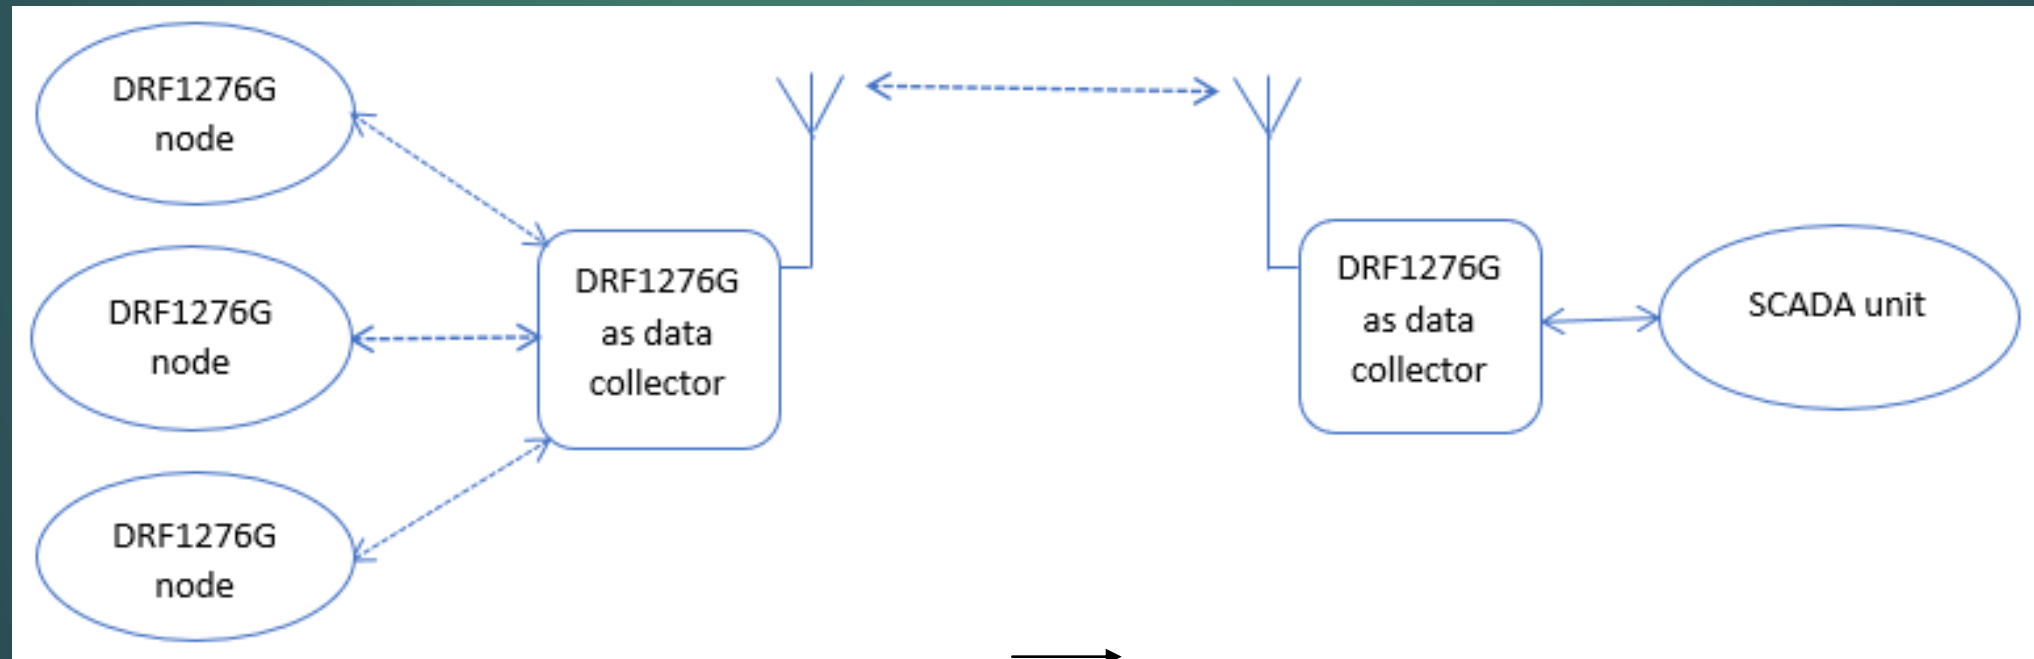

- Transposition Cipher

- Hill Cipher

- $ab \longrightarrow ci$ (key space N^n)

Breaching Encryption Algorithms

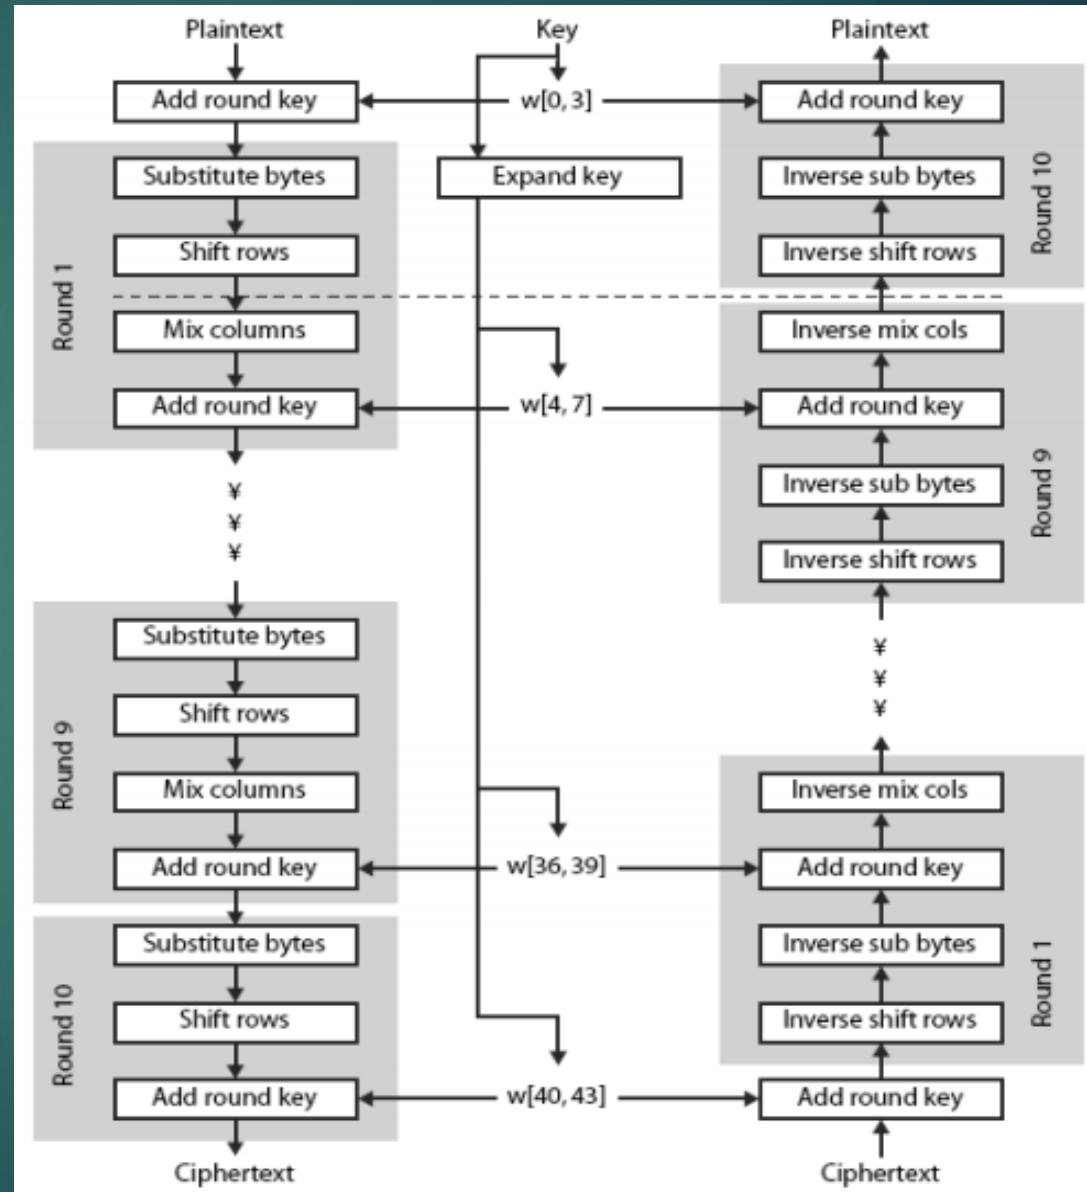

- ▶ FUGOMRPKWODRDTJHDTHPQTJDADFLZDITYFWCDLJDALRPNNQV
PHZDRF
- ▶ Themonkeys pawpart without the night was cold and wet but in the

- Occurrence frequency of characters/pairs
- Encryption algorithm
- Size of the block
- C++ code

Advanced Encryption Standard (AES) Algorithms

key space has 2^{128}

AES Secrecy

- Perfect secrecy (almost impossible to break regardless of time and resources used but, all known ciphers are relatively secure)
- Enumeration of large numbers

AES key size is 2^{128} , a glance at 2^{128} calculations

2^{128} vs 2^{100}

2^{100} en $\approx 40,000$ b years

@ 1 encryption/ns)

Time for evolution of a species $\approx 2^{20}$ years

Age of the earth = 2^{32} years

Bits in a terabyte drive = 2^{43}

Cells in the human body $\geq 2^{46}$

Amount of water in the Great Lakes = 2^{53} gallons

Estimate of atoms in observable universe $\approx 2^{265}$

Advanced Encryption Standards (AES) Algorithm

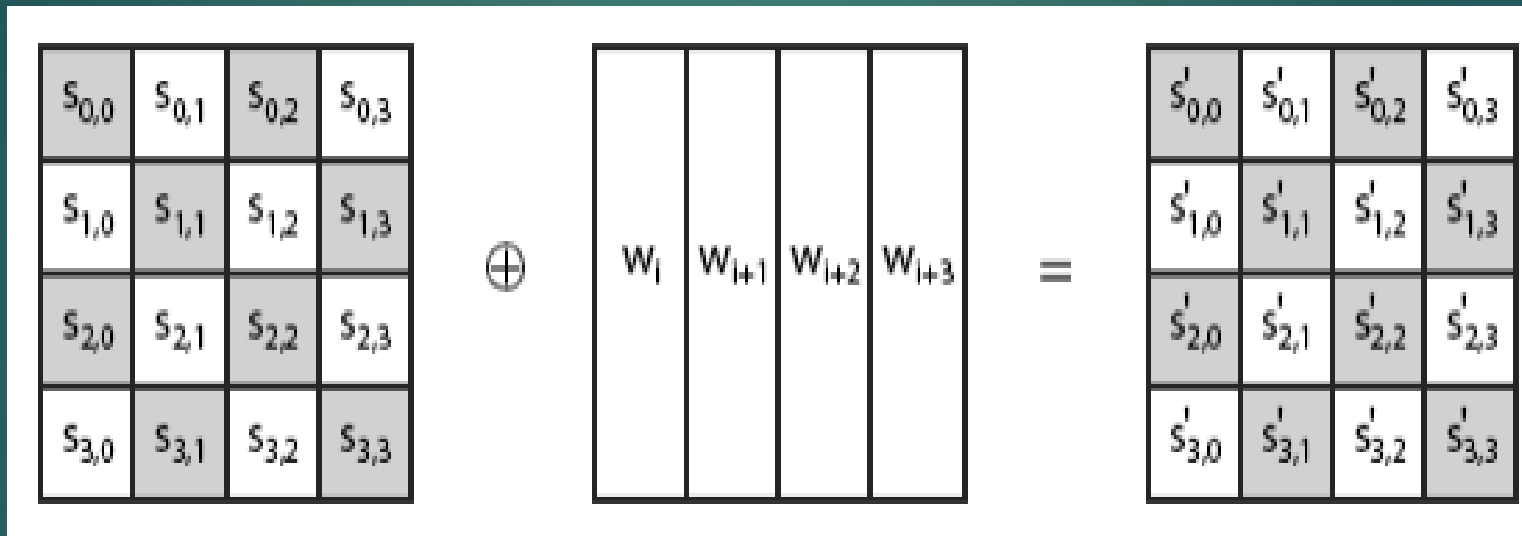

- Flexibility in changing key
- Multiple rounds and increased confusion
- Add round key
- Substitute bytes with Rijindal's table
- Shift rows
- Mix columns

AES Implementation

Generate and Add Round-key

- A 128bit key is generated and XORed with the string of 128bit plaintext before and after each round

- After adding round key, resultant bytes are replaced with respective Rijndael's table

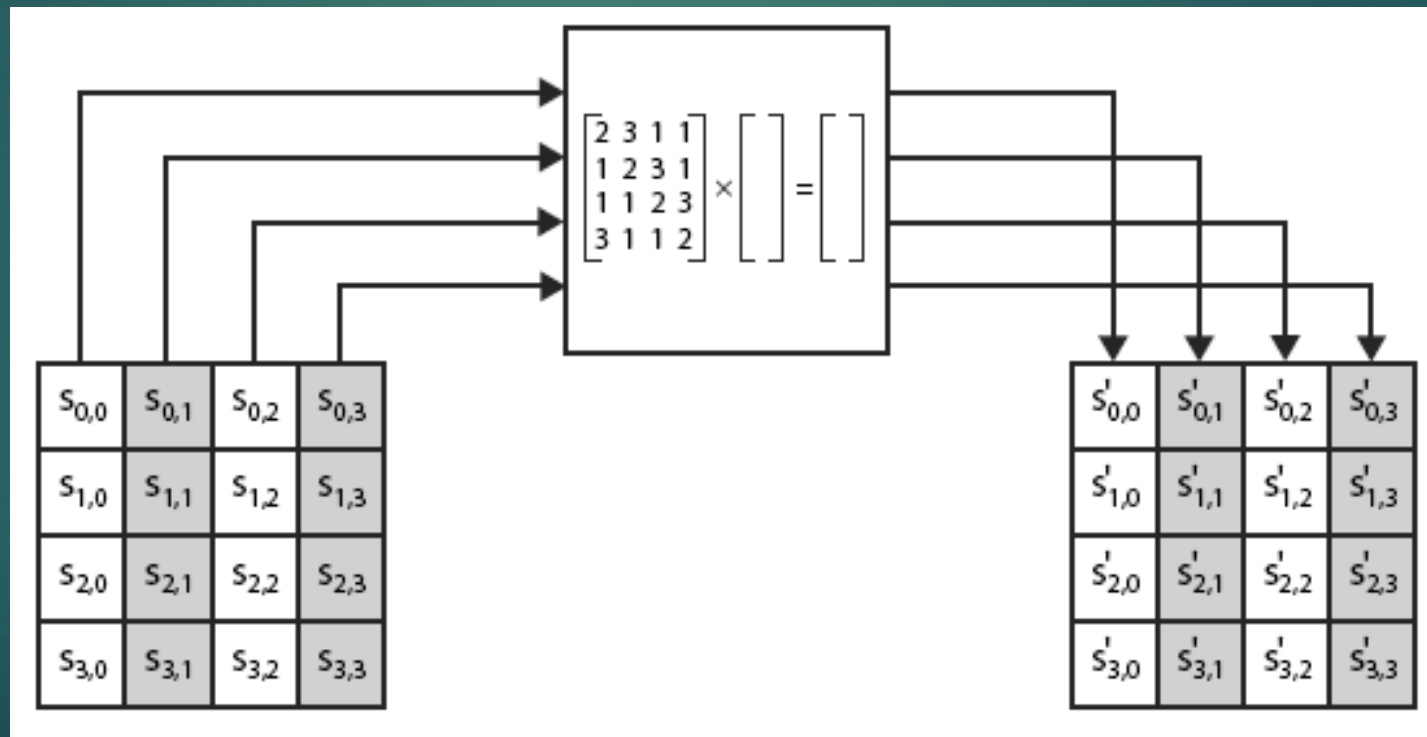

Shift Rows

- Substituted bytes are rotated left/right to increase the confusion within the same round

Mix Columns

- Substitution bytes results undergo through bit-level multiplication (involving 1's and 2's complements) and again results are replaced with Rajindal's inverse matrix

Message Authentication Code (MAC)

- MAC is unique for every message
- Fixed size of 64bits regardless of message length
- Derived from the XOR combination of plaintext and ciphertext bits
- Helpful in detecting a single bit change due to
 - Electromagnetic Interference
 - Eavesdropper
 - Channel Failure
 - Noise

Authenticity and MAC address

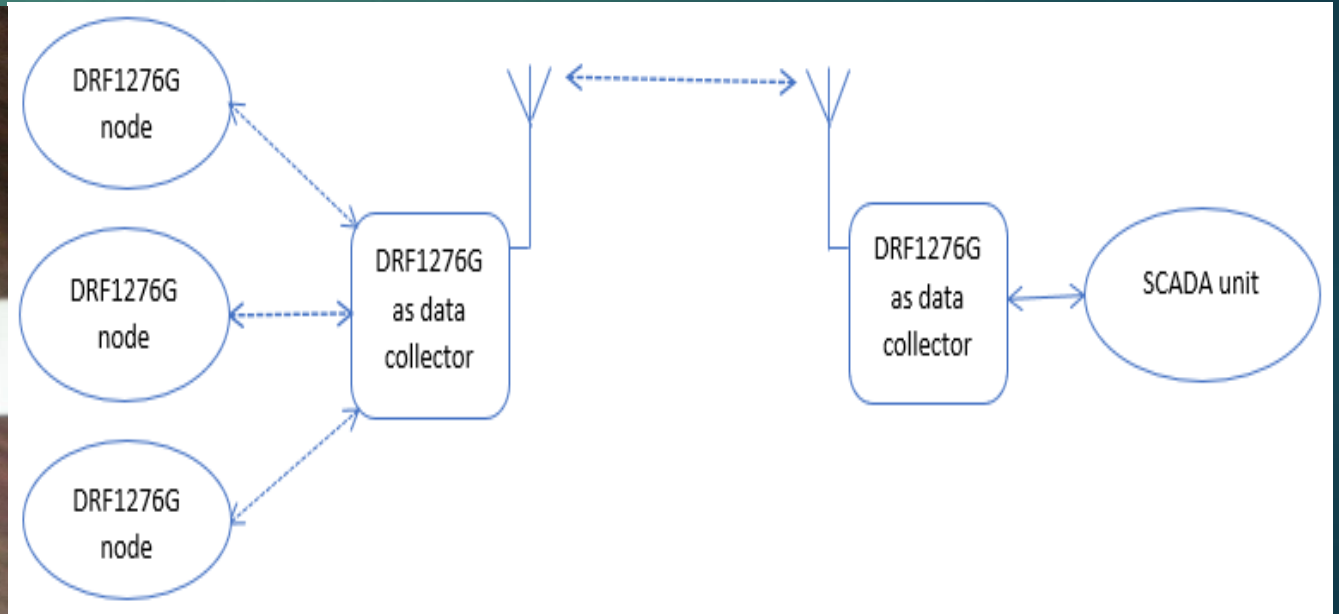

- MAC is concatenated at the end of encrypted string before transmitting the message
- Receiver splits MAC from message and decrypts the message
- From decrypted message again MAC is calculated using secret key and is compared with received MAC to check message authenticity
- Message is processed after ensuring authenticity. In case of mismatch message is discarded assuming fake/eavesdropper involvement

Results

Arduino-uno+LoRa (DRF1276G) based System Structure

- DRF1276G supports relatively simple encryption algorithms in given system structure
- It does not support AES due to flash and processor limitations

Ciphertext with Arduino-uno+LoRa

- Results show that arduino-uno with LoRa (DORJI DRF1276G) does not support 128AES due to flash size and ALU limitations

Verified decrypted message is: 0123456789ABCDEF0123456789ABCDEF
```

The diagram illustrates the MAC process. In the first example, a 128-bit plain-text (0123456789ABCDEF0123456789ABCDEF) is concatenated with a 64-bit MAC (410DFC5C95DFF8CE) to form the ciphertext (F9F026E7CD825F05A559FE74E4656FE9410DFC5C95DFF8CE). The MAC is calculated from the plain-text and verified against the received MAC. The second example shows the same process with a different MAC value (410DFC5C95DFF8CE). The third example shows the same process with a different MAC value (410DFC5C95DFF8CE).

ESP32 Based System Structure with AES and MAC implementation

- AES was successfully implemented in this system topology
- It worked for MAC implementation to authenticate the messages
- It does not cost more than CAD78 (3x26) with power consumption of 500-600mW

Range Testing (Successful transmission for 3.85km)

- Range Testing (Successful transmission for 3.85km)
- Range is obstacles dependent and site dependent
- Off-site range is 3-5km
- On-site upto 15km (obstacles free)

SF7 Affecting Transmission Rate and Authenticity

- Low SF gives better data rate
- Due to smaller time on air data loss decreases
- Loss free data verified through MAC improves reliability

SF12 Affecting Transmission Rate and Authenticity

- Increasing SF causes slow data rate
- Due to increase time on air data loss occurs
- Due to mismatch in received and calculated MAC system perceives that as the intervention of any eavesdropper

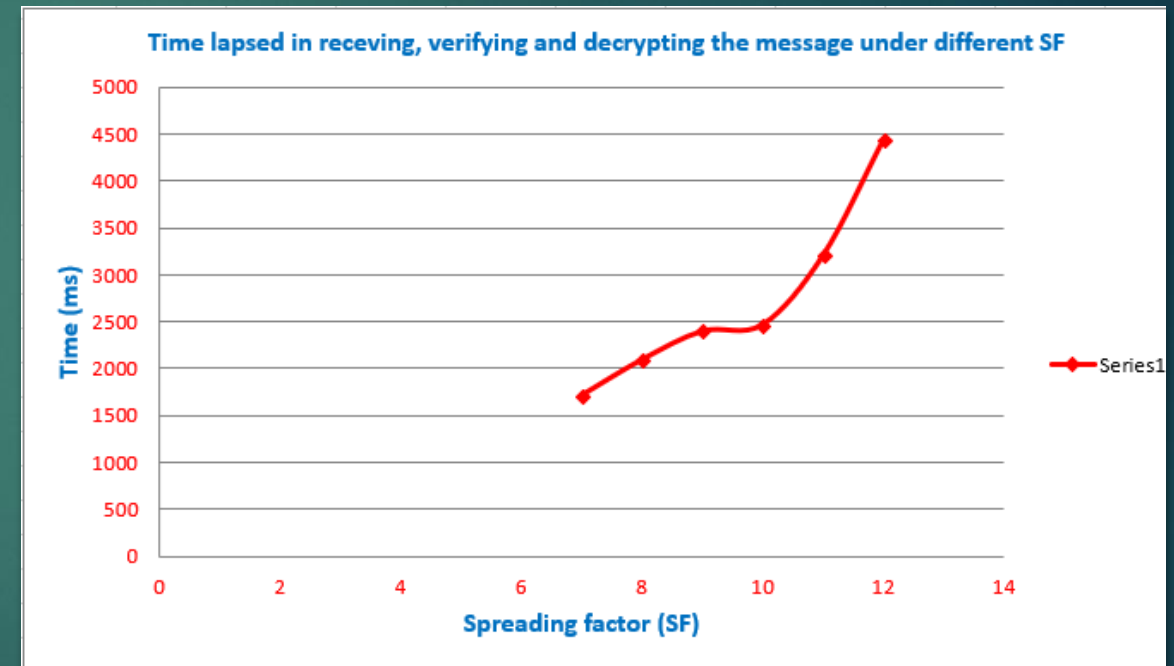

SF vs Delay in Encrypting and Sending

- Higher spreading factor requires more time for
 - Message encryption
 - Verification
 - Decryption

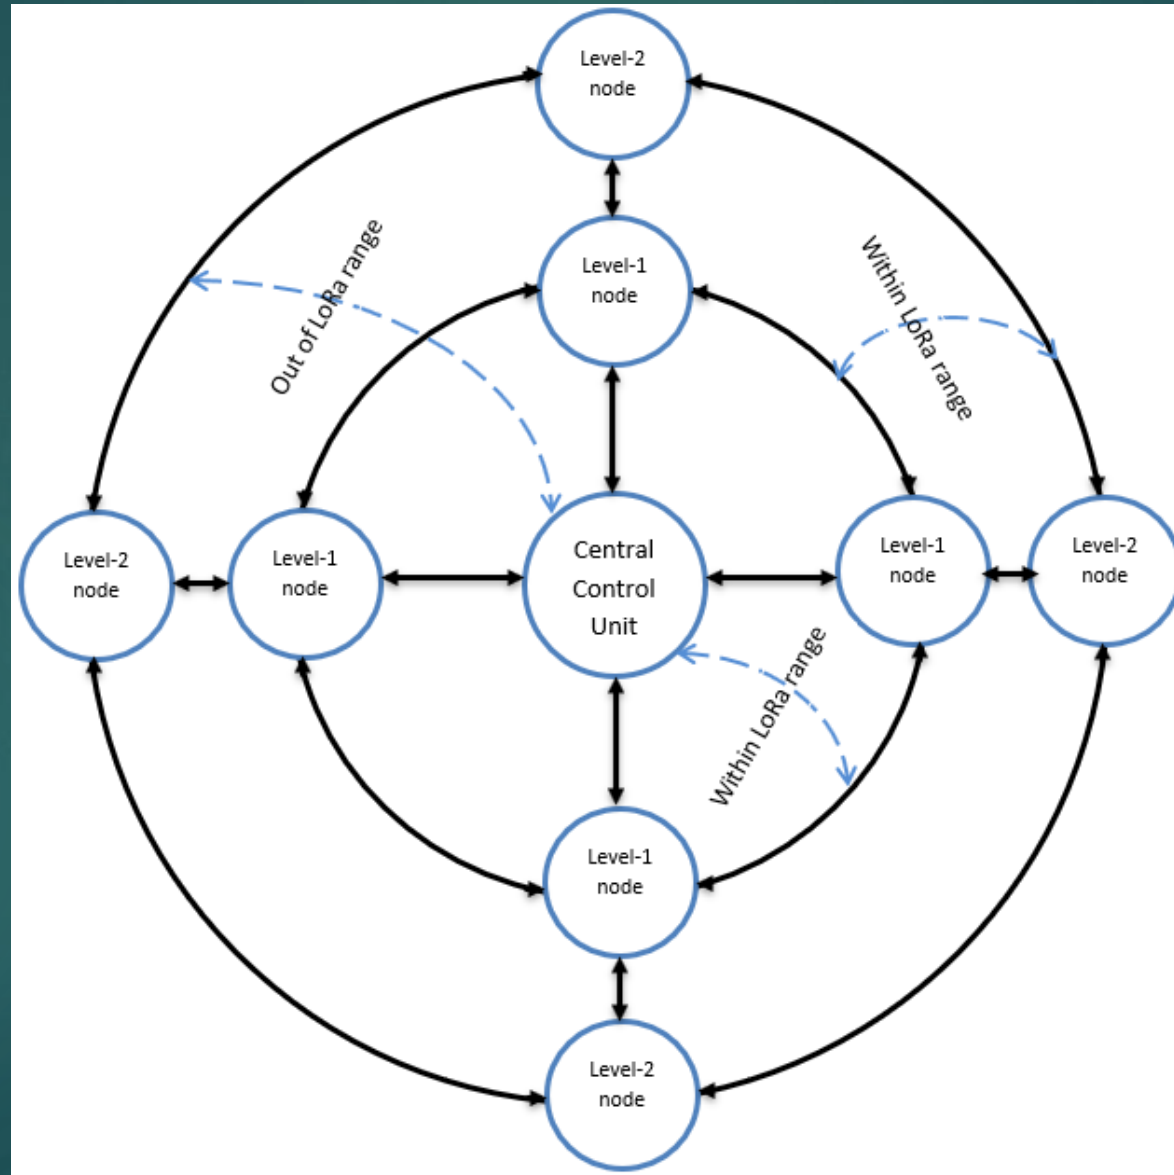

SF vs Delay in Receiving, Verifying and Decrypting

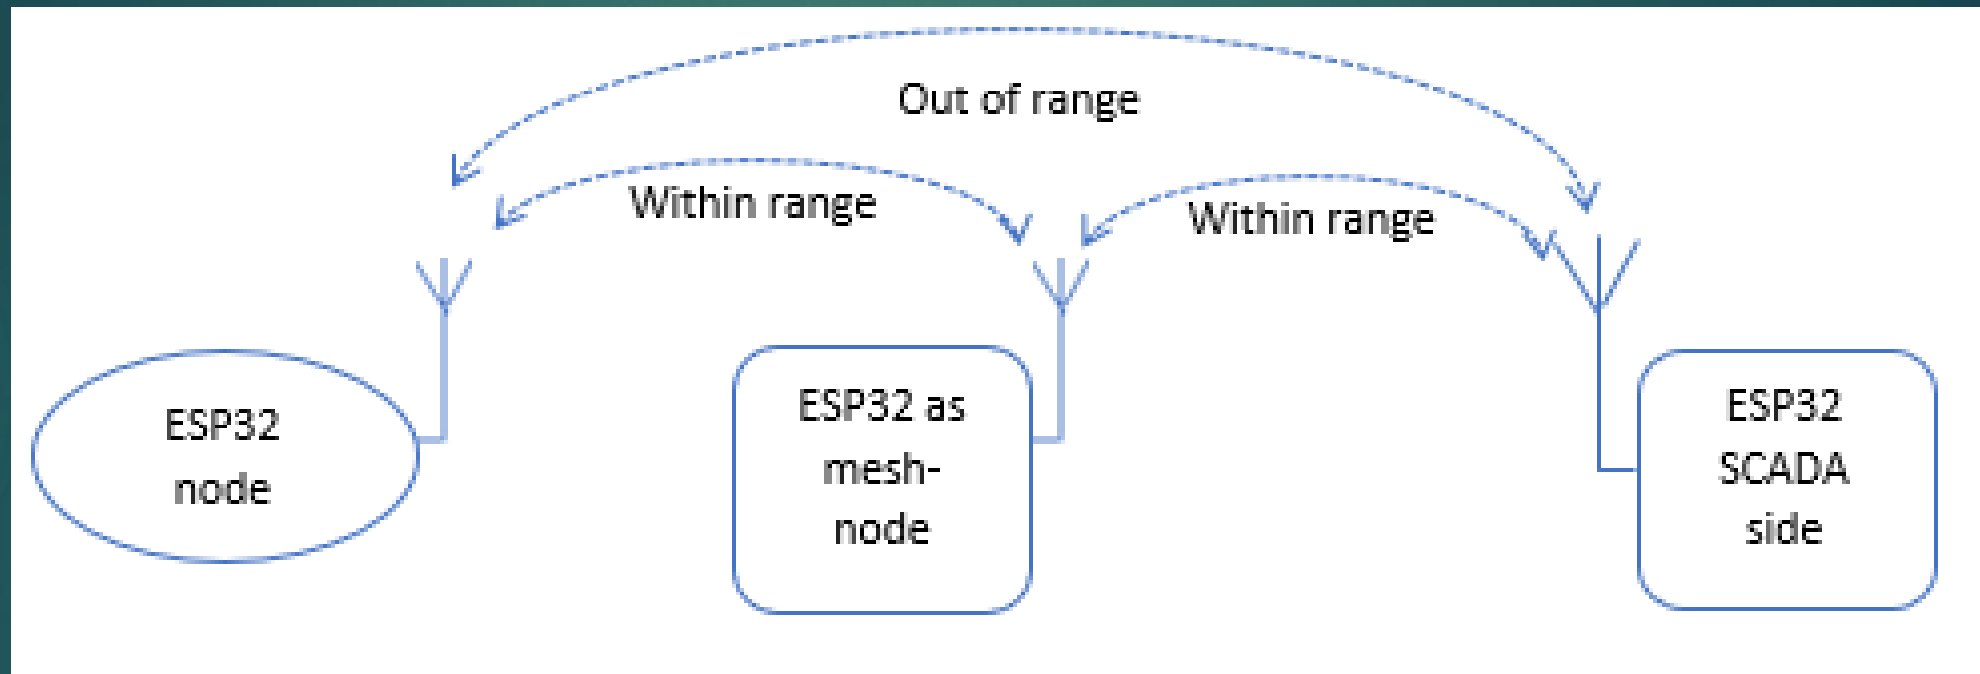

- With increasing spreading factor message on air time increases due to which overall time required for
 - Message receiving
 - Verifying and
 - Decryptingalso increases
- At low spreading factor message on air time is low but, range is shorter as compared to higher spreading factor
- At higher spreading factor data loss/bit error occurs due to increase in air time

Remote Data Logging (Configuring ESP32 as a Gateway)

The screenshot displays the 'ESP Gateway Config' web interface. At the top, the browser address bar shows '192.168.0.100/'. The page title is 'ESP Gateway Config'. Below the title, there is a version string 'Version: V5.3.3.H: 190825a' and system status information: 'ESP alive since Tuesday 15-1-2019 19:18:11, Uptime: 0:00:00.46' and 'Current time Tuesday 15-1-2019 19:18:42'. There are three navigation buttons: 'Documentation', 'Expert Mode', and 'Log Files'. The main content area is divided into three sections: 'Package Statistics', 'Message History', and 'Gateway Settings'.

Logging Data to The Things Network

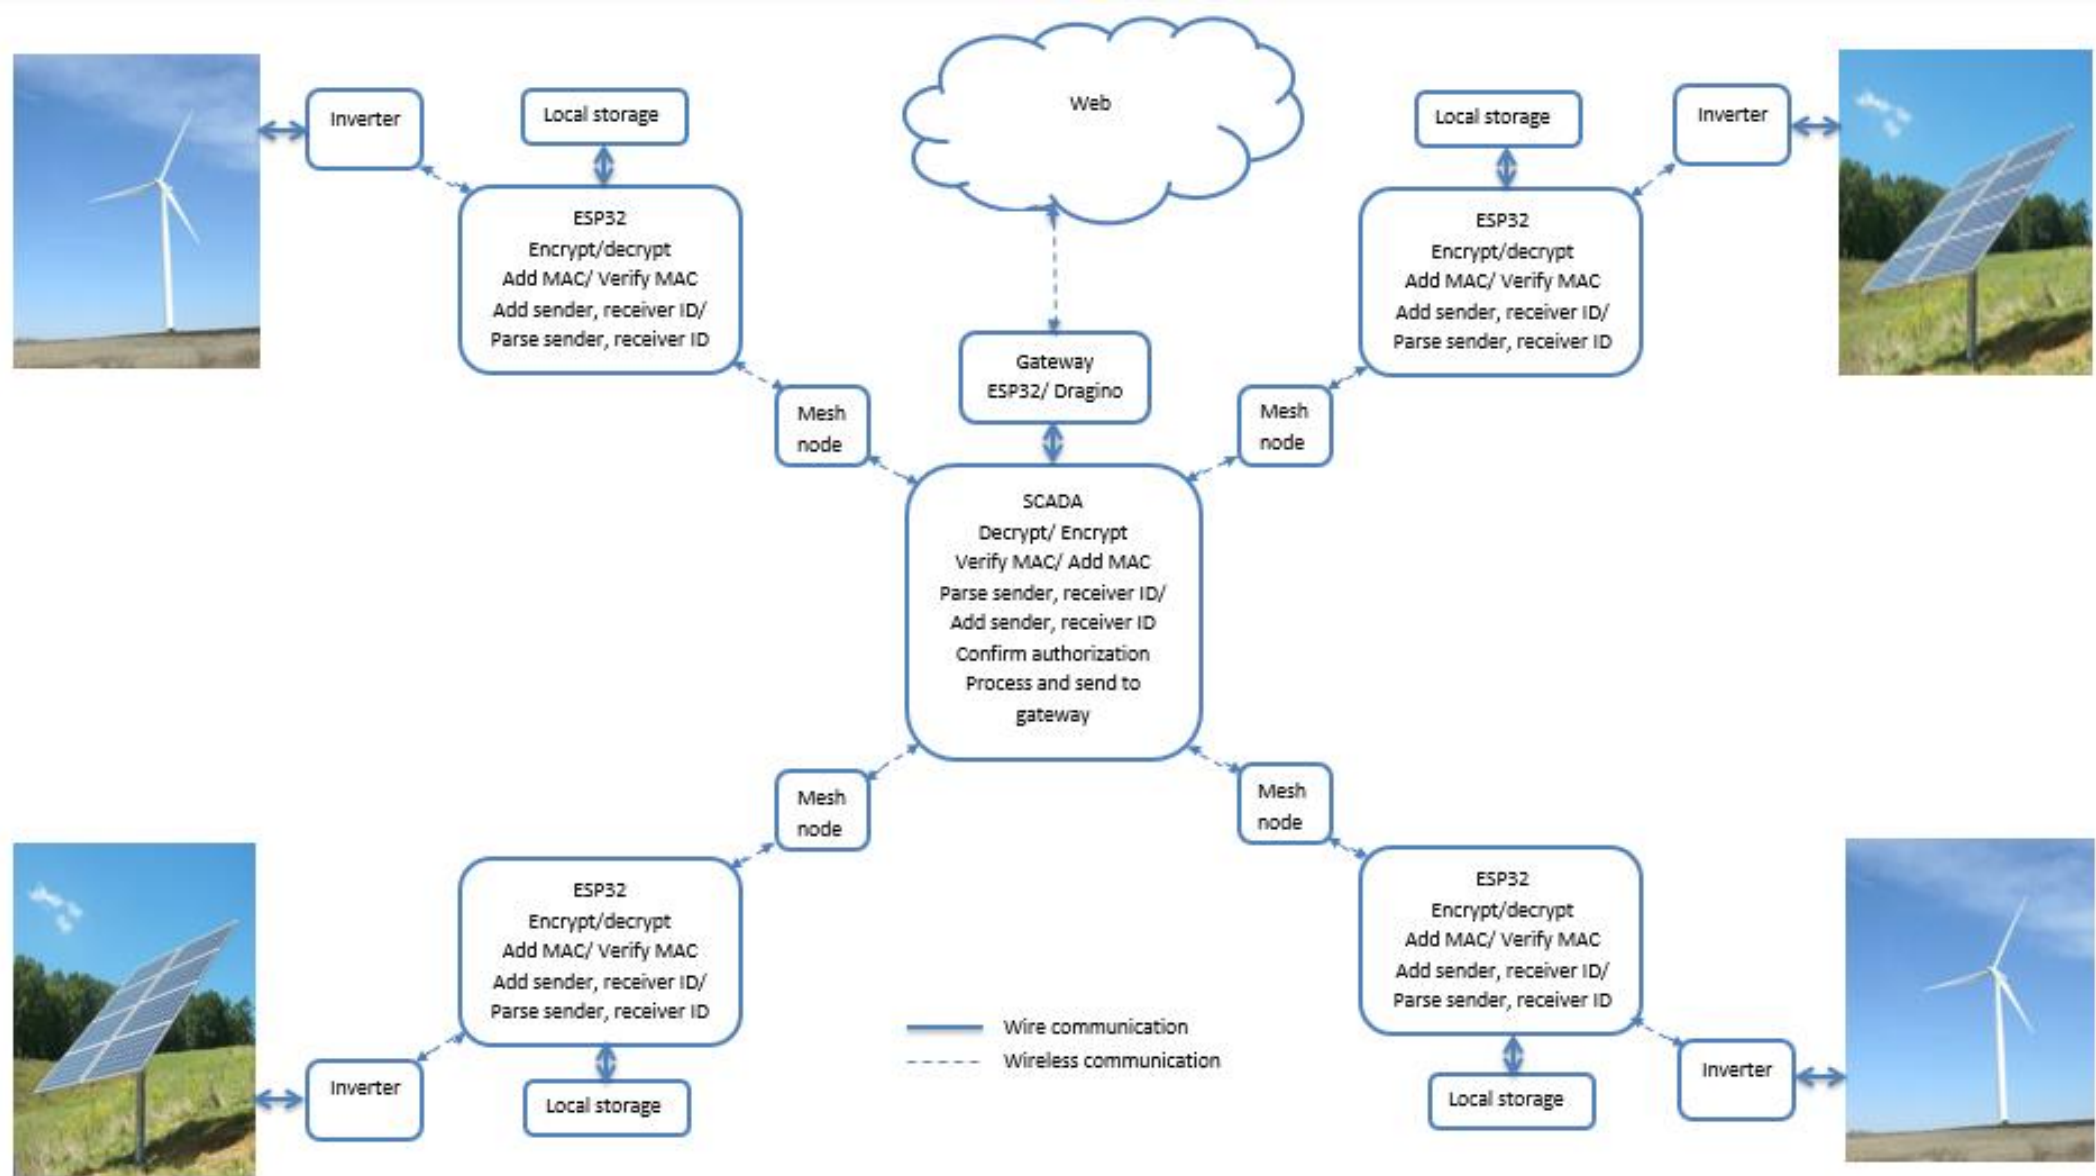

The screenshot displays the 'APPLICATION DATA' section of the The Things Network Console. The breadcrumb navigation shows the path: Applications > inverter_side_node > Devices > inverter_1 > Data. The page title is 'APPLICATION DATA' with 'pause' and 'clear' controls. A filter bar includes 'uplink', 'downlink', 'activation', 'ack', and 'error'. The data table has columns for 'time', 'counter', 'port', and 'payload'. Four data rows are visible, all showing an uplink from port 1 with a counter value between 172 and 196 and a consistent payload of '01 67 FF FF 02 68 FF'.

time	counter	port	payload
▲ 14:39:55	196	1	payload: 01 67 FF FF 02 68 FF
▲ 14:38:19	188	1	payload: 01 67 FF FF 02 68 FF

Dragino Gateway for Remote Data Logging

LoRa Based Complete System Diagram

Radio set based System Structure-I

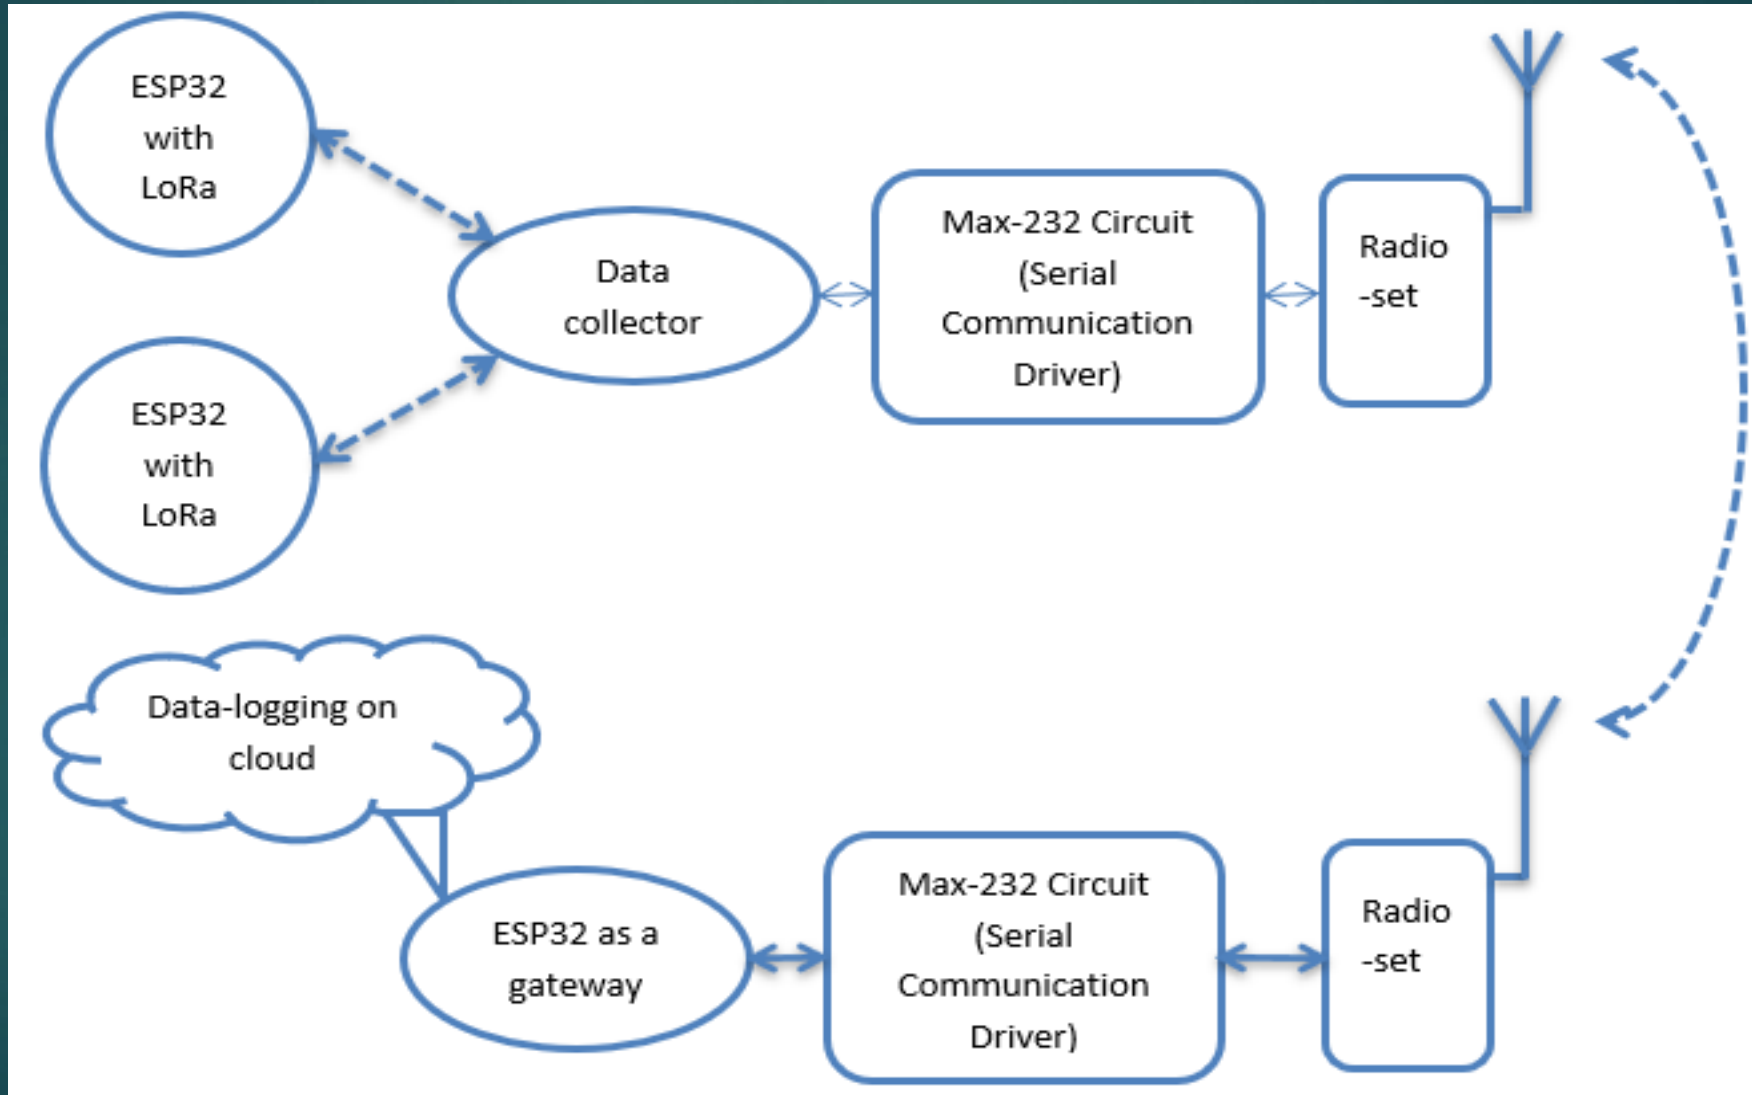

Data Logging in Hybrid System

The screenshot displays the 'USR-TCP232-Test RS232 to Ethernet Convert test' software interface. The window title bar shows '192.168.0.7' and 'DI-524'. The interface includes a menu bar with 'New(N)', 'File(F)', 'Options(O)', and 'Help(H)'. The 'COM Settings' section on the left is configured with 'PortNum: COM1', 'BaudR: 115200', 'DataB: 8 bit', and 'StopB: 1 bit'. The 'Recv Options' section has 'Add line return' checked. The 'Send Options' section has 'Data from file...', 'Auto Checksum', 'Auto Clear Input', 'Send As Hex', and 'Send Recycle' unchecked. The 'Network data receive' area in the center displays a list of received data: 'BCDEF01230123456789ABCDEF0123012', followed by 20 lines of '0123456789ABCDEF0123'. The 'Net Settings' section on the right shows '(1) Protocol: TCP Client', '(2) Server IP: 192.168.0.7', and '(2) Server Port: 20108'. The status bar at the bottom indicates 'LocalHost 192.168.0.201' and 'Port 54972'. The 'Send' button is highlighted in green. The footer text reads 'Jinan USR Technology Co., Ltd.'.

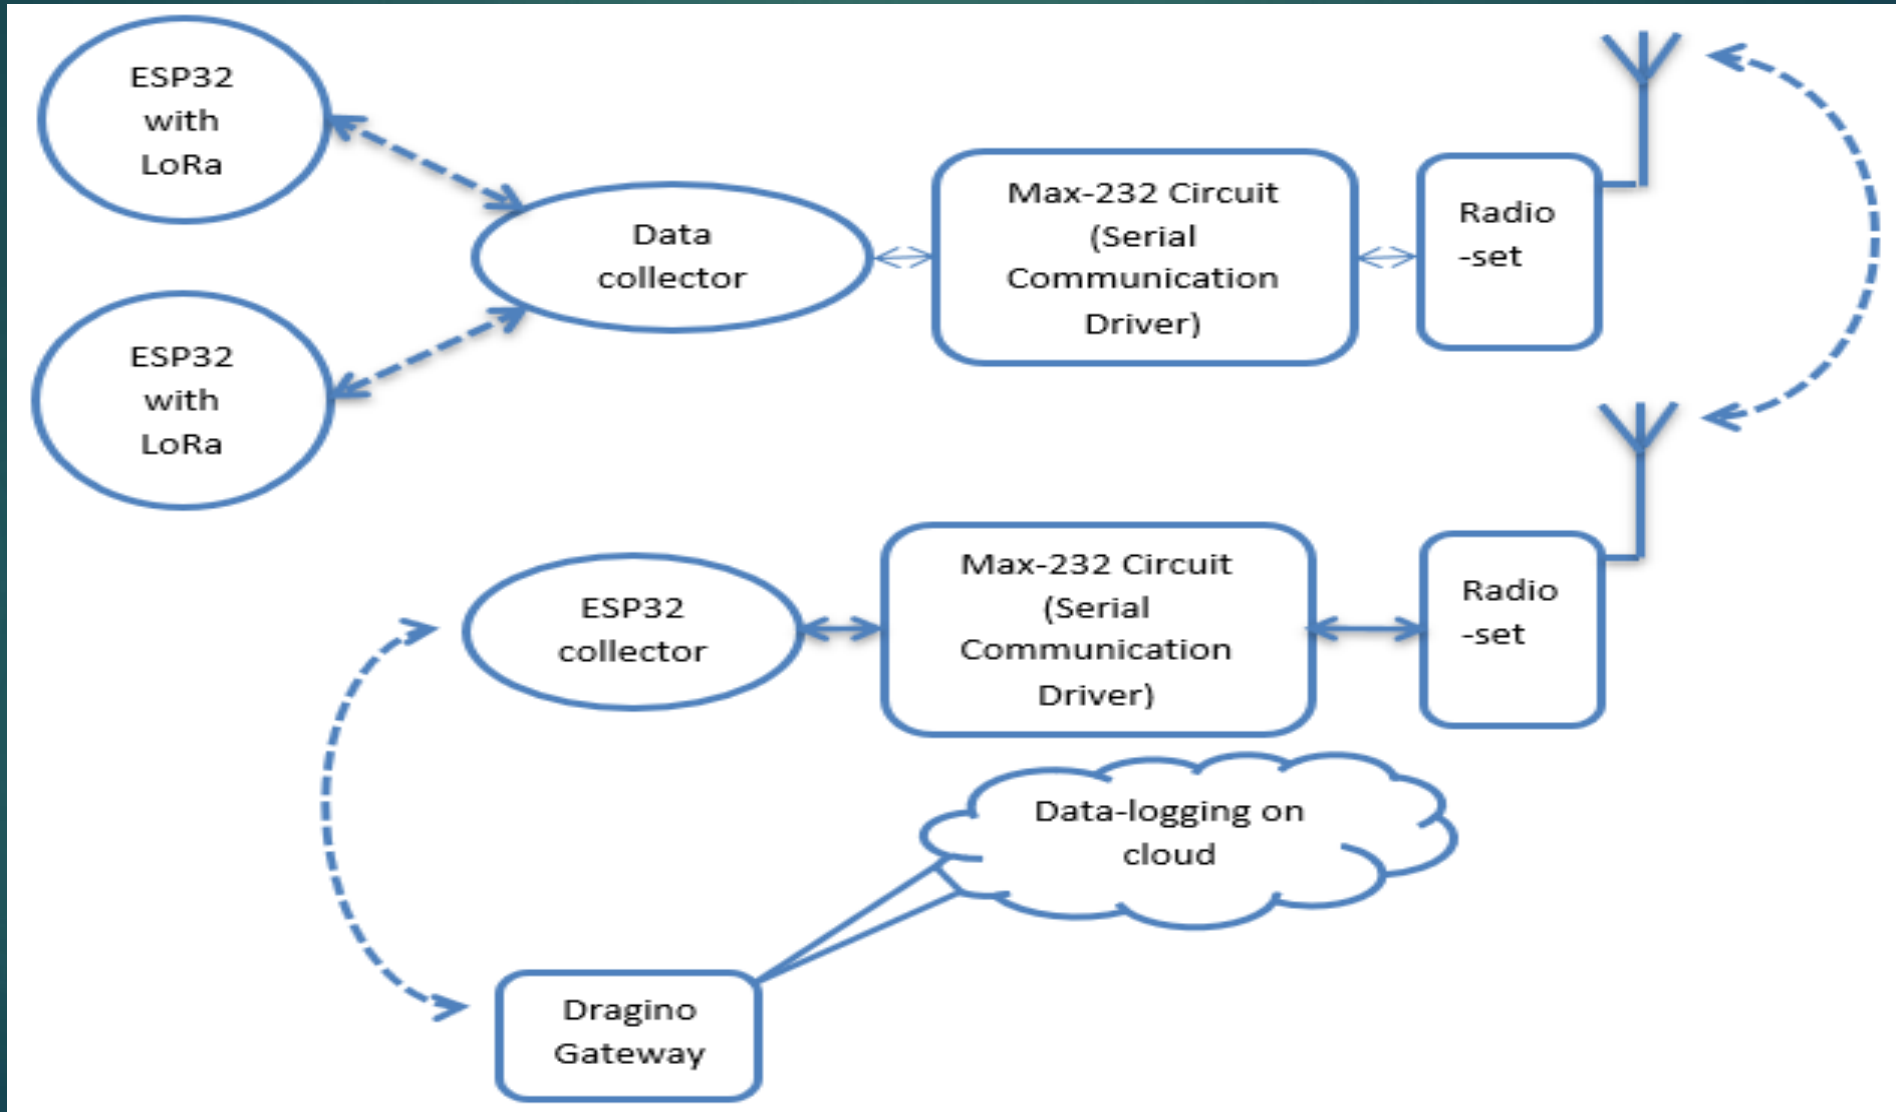

Configuring and Logging Data with Radio-set

Power consumption during stand-still mode = 9.6W

Cost Calculation of Radio-set based System Structure-III

Component	# of pieces used	\$/piece	Cumulative price (CAD)
ESP32	3	26	78
Dragino-yun	1	56	56
LSR-150-12 with Radio-set	2	109.53	219.56

Total capital cost =CAD353.56

Conclusion

1. LoRa based low power, low cost and long range communication system was selected after the literature study of twelve wireless and three wired technologies.
2. Implemented a secure communication system after trying five different encryption algorithms and assessing their strength against any attack.
3. Message authentication was achieved by generating a unique authentication code for each message.
4. Advanced Encryption Standard algorithm was implemented to secure the system against all known attacks.

Conclusion

5. Two different gateways were programmed and configured to access data remotely.
6. LoRa range was improved by implementing ESP32 based LoRa setup in mesh-network
7. A hybrid system of LoRa mesh-network and radio-sets was implemented to achieve the range of above 40km.

Future Work

1. A private server can be developed to eliminate any possible way of intruder's intervention through server side and internet.
2. Local controllers can be given certain privileges to minimize the communication of critical messages, and rank data based upon the data priority.
3. Local graphical user interfacing (Human Machine Interfacing) and control can be introduced to make the system more user friendly
4. Design a proper housing and power supply for communication link

Publications

Submitted

1. Amjad Iqbal and M. Tariq Iqbal, Low-cost and Secure Communication System for SCADA System of Remote Micro-grids, submitted with the Hindawi International Journal of Communication.

Published/Accepted

2. Amjad Iqbal and M. Tariq Iqbal, Low-cost and Secure Communication System for Remote Micro-grids using AES Cryptography on ESP32 with LoRa Module, presented at IEEE Electrical Power and Energy Conference (EPEC) 2018

3. Amjad Iqbal and M. Tariq Iqbal, Design and Analysis of a Stand-alone PV System for a Rural House in Pakistan, accepted in the Hindawi International Journal of Photoenergy

4. Amjad Iqbal and M. Tariq Iqbal, Thermal Modeling and Sizing of a Stand-Alone PV System for a Rural House in Pakistan, presented at 27th IEEE NECEC Conference 2018

Poster Presentation

5. Amjad Iqbal and M. Tariq Iqbal, Low-cost and Secure Communication System for Remote Micro-grids using AES Cryptography and ESP32 with LoRa, Presented in poster session at Ryerson University, Toronto ON, during NESTNet 2nd Annual Technical Conference, June 19-20, 2018
